5 Two-Way Crossed Classification

Days to first germination of three varieties of carrot seed grown in two types of potting soil.

| Soil Tpye | Variety | | |
|--------------|----------------|----------------|----------------|
| | 1 | 2 | 3 |
| 1 | $y_{111} = 6$ | $y_{121} = 13$ | $y_{131} = 14$ |
| | $y_{112} = 10$ | $y_{122} = 15$ | $y_{132} = 22$ |
| | $y_{113} = 11$ | | |
| | | | |
| 2 | $y_{211} = 12$ | $y_{221} = 31$ | $y_{231} = 18$ |
| | $y_{212} = 15$ | | $y_{232} = 9$ |
| | $y_{213} = 19$ | | $y_{233} = 12$ |
| | $y_{214} = 18$ | | |

This might be called “an unbalanced factorial experiment”.

Sample sizes:

| Soil type | Variety | | |
|--------------|--------------|--------------|--------------|
| | 1 | 2 | 3 |
| 1 | $n_{11} = 3$ | $n_{12} = 2$ | $n_{13} = 2$ |
| 2 | $n_{21} = 4$ | $n_{22} = 1$ | $n_{23} = 3$ |

In general we have

- $i = 1, 2, \dots, a$ levels for the first factor
- $j = 1, 2, \dots, b$ levels for the second factor
- $n_{ij} > 0$ observations at the i -th level of the first factor and the j -th level of the second factor

We will restrict our attention to normal-theory Gauss-Markov models.

5.1 “Cell Means” Model

$$y_{ijk} = \mu_{ij} + \epsilon_{ijk}$$

where

$$\epsilon_{ijk} \sim NID(0, \sigma^2) \quad \begin{cases} i = 1, \dots, a \\ j = 1, \dots, b \\ k = 1, \dots, n_{ij} \end{cases}$$

Clearly, $E(y_{ijk}) = \mu_{ij}$ is estimable if $n_{ij} > 0$.

Overall mean response:

Mean response at i -th level of factor 1,
averaging across the levels of factor 2.

Mean response at j -th level of factor 2,
averaging across the levels of factor 1

Contrasts of interest:
“main effects” for factor 1:

“main effects” for factor 2:

Conditional effects:

Interaction contrasts:

All of these contrasts are **estimable** when

$$n_{ij} > 0 \quad \text{for all } (i, j)$$

because

- $E(\bar{y}_{ij.}) = \mu_{ij}$
- Any linear function of estimable functions is estimable

5.2 An “Effects” Model

$$y_{ijk} = \mu + \alpha_i + \beta_j + \gamma_{ij} + \epsilon_{ijk}$$

where

$$\begin{aligned} \epsilon_{ijk} &\sim NID(0, \sigma^2) \\ i &= 1, 2, \dots, a \\ j &= 1, 2, \dots, b \\ k &= 1, 2, \dots, n_{ij} > 0 \end{aligned}$$

$$\begin{bmatrix} y_{111} \\ y_{112} \\ y_{113} \\ y_{121} \\ y_{122} \\ y_{131} \\ y_{132} \\ y_{211} \\ y_{212} \\ y_{213} \\ y_{214} \\ y_{221} \\ y_{231} \\ y_{232} \\ y_{233} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mu \\ \alpha_1 \\ \alpha_2 \\ \beta_1 \\ \beta_2 \\ \beta_3 \\ \gamma_{11} \\ \gamma_{12} \\ \gamma_{13} \\ \gamma_{21} \\ \gamma_{22} \\ \gamma_{23} \end{bmatrix} + \epsilon$$

5.2.1 Baseline Restrictions

The resulting restricted model is

$$y_{ijk} = \mu + \alpha_i + \beta_j + \gamma_{ij} + \epsilon_{ijk}$$

where

$$\epsilon_{ijk} \sim NID(0, \sigma^2) \quad \begin{cases} i = 1, \dots, a \\ j = 1, \dots, b \\ k = 1, \dots, n_{ij} \end{cases}$$

and

$$\begin{aligned} \alpha_a &= 0 \\ \beta_b &= 0 \\ \gamma_{ib} &= 0 \text{ for all } i = 1, \dots, a \\ \gamma_{aj} &= 0 \text{ for all } j = 1, \dots, b \end{aligned}$$

We will call these the “baseline” restrictions.

| | | | | |
|-------|--|--|-----------------------------|--|
| | | | | Soil |
| | | | | Type |
| Soil | | | | |
| Type | Variety 1 | Variety 2 | Variety 3 | Means |
| 1 | $\mu_{11} = \mu + \alpha_1$ $+ \beta_1 + \gamma_{11}$ | $\mu_{12} = \mu + \alpha_1$ $+ \beta_2 + \gamma_{12}$ | $\mu_{13} = \mu + \alpha_1$ | $\mu + \alpha_1$ $+ \frac{\beta_1 + \beta_2}{3}$ $+ \frac{\gamma_{11} + \gamma_{12}}{3}$ |
| 2 | $\mu_{21} = \mu + \beta_1$ | $\mu_{22} = \mu + \beta_2$ | $\mu_{23} = \mu$ | $\mu + \frac{\beta_1 + \beta_2}{3}$ |
| Var. | | | | |
| means | $\mu + \frac{\alpha_1}{2} + \beta_1 + \frac{\gamma_{11}}{2}$ | $\mu + \frac{\alpha_1}{2} + \beta_2 + \frac{\gamma_{12}}{2}$ | $\mu + \frac{\alpha_1}{2}$ | |

Interpretation:

$\mu =$

$\alpha_i =$

$\beta_j =$

$\gamma_{ij} =$

Matrix formulation:

Least squares estimation:

Comments:

Imposing a set of restrictions on the parameters in the “effects” model

$$y_{ijk} = \mu + \alpha_i + \beta_j + \gamma_{ij} + \epsilon_{ijk}$$

to obtain a model matrix with full column rank.

(i) Avoids the use of a generalized inverse in least squares estimation.

(ii) Is equivalent to choosing a generalized inverse for $\mathbf{b} = (\mathbf{X}^T \mathbf{X})^{-} \mathbf{X}^T \mathbf{y}$ in the unrestricted “effects” model.

(iii) Restrictions must involve “non-estimable” quantities for the unrestricted “effects” model.

(iv) Baseline restrictions using by SAS are

$$\begin{aligned} \alpha_a &= 0 & \beta_b &= 0 \\ \gamma_{ib} &= 0 & \text{for all } i = 1, \dots, a \\ \gamma_{aj} &= 0 & \text{for all } j = 1, \dots, b \end{aligned}$$

(v) Baseline restrictions using by R are

$$\begin{aligned} \alpha_1 &= 0 & \beta_1 &= 0 \\ \gamma_{i1} &= 0 & \text{for all } i = 1, \dots, a \\ \gamma_{1j} &= 0 & \text{for all } j = 1, \dots, b \end{aligned}$$

5.2.2 Σ-Restrictions

$$y_{ijk} = \omega + \gamma_i + \delta_j + \eta_{ij} + \epsilon_{ijk}$$

\nwarrow
 $\mu_{ij} = E(y_{ijk})$

where

$$\epsilon_{ijk} \sim NID(0, \sigma^2) \text{ and } \sum_{i=1}^a \gamma_i = 0 \quad \sum_{j=1}^b \delta_j = 0$$

$$\sum_{i=1}^a \eta_{ij} = 0 \quad \text{for each } j = 1, \dots, b$$

$$\sum_{j=1}^b \eta_{ij} = 0 \quad \text{for each } i = 1, \dots, a$$

Interpretation:

$\omega =$

$$\delta_j - \delta_k =$$

Similarly,

$$\gamma_1 - \gamma_2 =$$

For a model that includes the Σ -restrictions:

$$\eta_{ij} =$$

Matrix formulation:

Least squares estimation:

If restrictions are placed on “non-estimable” functions of parameters in the unrestricted “effects” model, then

- The resulting models are reparameterizations of each other.
- $\hat{\mathbf{y}} = P_{\mathbf{X}}\mathbf{y}$

$$\mathbf{e} = \mathbf{y} - \hat{\mathbf{y}} = (I - P_{\mathbf{X}})\mathbf{y}$$

$$SSE = \mathbf{e}^T \mathbf{e} = \mathbf{y}^T (I - P_{\mathbf{X}}) \mathbf{y}$$

$$\hat{\mathbf{y}}^T \hat{\mathbf{y}} = \mathbf{y}^T P_{\mathbf{X}} \mathbf{y}$$

$$SS_{\text{model}} = \mathbf{y}^T (P_{\mathbf{X}} - P_{\mathbf{1}}) \mathbf{y}$$

are the same for any set of restrictions.

- The solution to the normal equations

$$\mathbf{b} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

and interpretations of the corresponding parameters will not be the same for all such sets of restrictions.

If you were to place restrictions on estimable functions of parameters in

$$y_{ijk} = \mu + \alpha_1 + \beta_j + \gamma_{ij} + \epsilon_{ijk}$$

then you would change

- $\text{rank}(\mathbf{X})$
- space spanned by the columns of \mathbf{X}
- $\hat{\mathbf{y}} = \mathbf{X}(\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$ and OLS estimators of other estimable quantities.

Example 1.

In a study to examine the effect of temperature on percent shrinkage in dyeing fabrics was made on two replications for each of four fabrics in a complete randomized design. The data are the percent shrinkage of two replication fabric pieces dried at each of the four temperatures.

| Fabric | Temperature | | | |
|--------|-------------|----------|----------|------------|
| | 210° | 215° | 220° | 225° |
| 1 | 1.8, 2.1 | 2.0, 2.1 | 4.6, 5.0 | 7.5, 7.9 |
| 2 | 2.2, 2.4 | 4.2, 4.0 | 5.4, 5.6 | 9.8, 9.2 |
| 3 | 2.8, 3.2 | 4.4, 4.8 | 8.7, 8.4 | 13.2, 13.0 |
| 4 | 3.2, 3.6 | 3.3, 3.5 | 5.7, 5.8 | 10.9, 11.1 |

Consider the model $y_{ijk} = \mu + \alpha_i + \beta_j + \gamma_{ij} + \epsilon_{ijk}$ where $\epsilon_{ijk} \sim NID(0, \sigma^2)$ and y_{ijk} denotes the percent shrinkage in dyeing fabric for the k -th fabric piece given the j -th temperature with the i -th fabric.

1. Note that the application of the `lm()` function in R imposes some restrictions to solve the normal equations. What are the restrictions?

2. Give an interpretation of α_4 , $\alpha_2 - \alpha_4$ and γ_{24} with respect to the restricted model and the mean change in systolic blood pressure.
3. The effects model under the R baseline restriction has parameter vector for mean responses

$$\boldsymbol{\delta} = (\mu, \alpha_2, \alpha_3, \alpha_4, \beta_2, \beta_3, \beta_4, \gamma_{22}, \gamma_{23}, \gamma_{24}, \gamma_{32}, \gamma_{33}, \gamma_{34}, \gamma_{42}, \gamma_{43}, \gamma_{44})'$$

- (a) Determine a matrix \mathbf{C} so that the testable hypothesis $H_0 : \mathbf{C}\boldsymbol{\delta} = 0$ is the hypothesis $H_0 : \mu_{.1} = \mu_{.2} = \mu_{.3} = \mu_{.4}$ where $\mu_{.j} = \frac{1}{4} \sum_{i=1}^4 \mu_{ij}$.
- (b) Determine a matrix \mathbf{C} so that the testable hypothesis $H_0 : \mathbf{C}\boldsymbol{\delta} = 0$ is the hypothesis $H_0 : \mu_{1.} = \mu_{2.} = \mu_{3.} = \mu_{4.}$ where $\mu_{i.} = \frac{1}{3} \sum_{j=1}^3 \mu_{ij}$.

5.3 Normal Theory Gauss-Markov Model

$$y_{ijk} = \mu + \alpha_i + \beta_j + \gamma_{ij} + \epsilon_{ijk}$$

5.3.1 Analysis of Variance

$$\begin{aligned} \mathbf{y}^T \mathbf{y} &= \mathbf{y}^T P_{\mu} \mathbf{y} + \mathbf{y}^T (P_{\mu, \alpha} - P_{\mu}) \mathbf{y} \\ &\quad + \mathbf{y}^T (P_{\mu, \alpha, \beta} - P_{\mu, \alpha}) \mathbf{y} \\ &\quad + \mathbf{y}^T (P_{\mathbf{X}} - P_{\mu, \alpha, \beta}) \mathbf{y} \\ &\quad + \mathbf{y}^T (I - P_{\mathbf{X}}) \mathbf{y} \\ &= R(\mu) + R(\alpha | \mu) + R(\beta | \mu, \alpha) \\ &\quad + R(\gamma | \mu, \alpha, \beta) + SSE \end{aligned}$$

By Cochran's Theorem, these quadratic forms (or sums of squares) have independent chi-square distributions with 1, $a - 1$, $b - 1$, $(a - 1)(b - 1)$, and $n_{\bullet\bullet} - ab$ degrees of freedom, respectively, (if $n_{ij} > 0$ for all (i, j))

MEME16203 LINEAR MODELS©DR YONG CHIN KHIAN

$$\begin{bmatrix} y_{111} \\ y_{112} \\ y_{113} \\ y_{121} \\ y_{122} \\ y_{131} \\ y_{132} \\ y_{211} \\ y_{212} \\ y_{213} \\ y_{214} \\ y_{221} \\ y_{231} \\ y_{232} \\ y_{233} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mu \\ \alpha_1 \\ \alpha_2 \\ \beta_1 \\ \beta_2 \\ \beta_3 \\ \gamma_{11} \\ \gamma_{12} \\ \gamma_{13} \\ \gamma_{21} \\ \gamma_{22} \\ \gamma_{23} \end{bmatrix} + \epsilon$$

| 1 | 0 | 0 | 0 | 0 | 0 | 1 | -1 | -1 | -1 | 1 | 1 |

$R(\mu) = \mathbf{y}^T P_\mu \mathbf{y}$ is the same for all three models
 $R(\mu, \alpha) = \mathbf{y}^T P_{\mu,\alpha} \mathbf{y}$ is the same for all three models and so is $R(\alpha|\mu) = R(\mu, \alpha) - R(\mu)$
 $R(\mu, \alpha, \beta) = \mathbf{y}^T P_{\mu,\alpha,\beta} \mathbf{y}$ is the same for all three models and so is $R(\beta|\alpha) = R(\mu, \alpha, \beta) - R(\mu, \alpha)$
 $R(\mu, \alpha, \beta, \gamma) = \mathbf{y}^T P_{\mathbf{X}} \mathbf{y}$ is the same for all three models and so is $R(\gamma|\mu, \alpha, \beta) = R(\mu, \alpha, \beta, \gamma) - R(\mu, \alpha, \beta)$

MEME16203 LINEAR MODELS©DR YONG CHIN KHIAN

Consequently, the partition

$$\begin{aligned}
 \mathbf{y}^T \mathbf{y} &= \mathbf{y}^T P_{\mu} \mathbf{y} + \mathbf{y}^T (P_{\mu, \beta} - P_{\mu}) \mathbf{y} \\
 &\quad + \mathbf{y}^T (P_{\mu, \alpha, \beta} - P_{\mu, \beta}) \mathbf{y} \\
 &\quad + \mathbf{y}^T (P_{\mathbf{X}} - P_{\mu, \alpha, \beta}) \mathbf{y} \\
 &\quad + \mathbf{y}^T (I - P_{\mathbf{X}}) \mathbf{y} \\
 &= R(\mu) + R(\beta | \mu) + R(\alpha | \mu, \beta) \\
 &\quad + R(\gamma | \mu, \alpha, \beta) + SSE
 \end{aligned}$$

is the same for all three models.

By Cochran's Theorem, these quadratic forms (or sums of squares) have independent chi-square distributions with 1, $b-1$, $a-1$, $(a-1)(b-1)$, and $n_{\bullet\bullet} - ab$ degrees of freedom, respectively, when $n_{ij} > 0$ for all (i, j) .

We have also shown earlier that

$$\begin{aligned}
 SSE &= \mathbf{y}^T (I - P_{\mathbf{X}}) \mathbf{y} \\
 &= \sum_{i=1}^a \sum_{j=1}^b \sum_{k=1}^{n_{ij}} (y_{ijk} - \bar{y}_{ij\bullet})^2 \\
 &\sim \chi_{n_{\bullet\bullet} - ab}^2
 \end{aligned}$$

Example 2.

Let $\mathbf{Y} \sim N(\mathbf{W}\boldsymbol{\gamma}, \sigma^2 I)$, where

- $\mathbf{W} = [\mathbf{W}_1 \ \mathbf{W}_2 \ \mathbf{W}_3 \ \mathbf{W}_4]$,
- $\mathbf{W}_1 = \mathbf{1}_{20}$,
- $\mathbf{W}_2 = \begin{bmatrix} 1 \\ -1 \end{bmatrix} \otimes \mathbf{1}_{10}$,
- $\mathbf{W}_3 = \mathbf{1}_2 \otimes \begin{bmatrix} 1 \\ -1 \end{bmatrix} \otimes \mathbf{1}_5$,
- $\mathbf{W}_4 = \mathbf{1}_4 \otimes \begin{bmatrix} -8 \\ -4 \\ 0 \\ 8 \\ 4 \end{bmatrix}$, and
- $\boldsymbol{\gamma} = \begin{bmatrix} \gamma_1 \\ \gamma_2 \\ \gamma_3 \\ \gamma_4 \end{bmatrix}$

(a) Use Cochran's theorem to find the distributions of

- $\frac{1}{\sigma^2} SSE = \mathbf{e}^T \mathbf{e} = \mathbf{Y}^T (\mathbf{I} - \mathbf{P}_W) \mathbf{Y}$, where $\mathbf{P}_W = \mathbf{W}(\mathbf{W}^T \mathbf{W})^{-1} \mathbf{W}^T$
- $\frac{1}{\sigma^2} R(\gamma_1) = \mathbf{Y}^T \mathbf{P}_{W_1} \mathbf{Y}$ where $\mathbf{W}_1 = \mathbf{1}$ is the first column of \mathbf{W} and $\mathbf{P}_{W_1} = \mathbf{W}_1(\mathbf{W}_1^T \mathbf{W}_1)^{-1} \mathbf{W}_1^T$.
- $\frac{1}{\sigma^2} R(\gamma_2 | \gamma_1) = \mathbf{Y}^T (\mathbf{P}_{W_2} - \mathbf{P}_{W_1}) \mathbf{Y}$ where \mathbf{W}_2 contains the first two columns of \mathbf{W} and $\mathbf{P}_{W_2} = \mathbf{W}_2(\mathbf{W}_2^T \mathbf{W}_2)^{-1} \mathbf{W}_2^T$.
- $\frac{1}{\sigma^2} R(\gamma_3 | \gamma_1 \gamma_2) = \mathbf{Y}^T (\mathbf{P}_{W_3} - \mathbf{P}_{W_2}) \mathbf{Y}$. where \mathbf{W}_3 contains the first three columns of \mathbf{W} and $\mathbf{P}_{W_3} = \mathbf{W}_3(\mathbf{W}_3^T \mathbf{W}_3)^{-1} \mathbf{W}_3^T$.
- $\frac{1}{\sigma^2} R(\gamma_4 | \gamma_1 \gamma_2 \gamma_3) = \mathbf{Y}^T (\mathbf{P}_W - \mathbf{P}_{W_3}) \mathbf{Y}$.

(b) Report a formula for the non-centrality parameter of the non-central F distribution of

$$F = \frac{R(\gamma_3|\gamma_1, \gamma_2)}{SSE/7}$$

Use it to the null and alternative hypotheses associated with this test statistic. You are given that:

$$\mathbf{W}^T(\mathbf{P}_{\mathbf{W}_3} - \mathbf{P}_{\mathbf{W}_2})\mathbf{W} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 20 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}.$$

5.3.2 Type I Sum of Squares

What null hypotheses are tested by F-tests derived from such ANOVA tables

$R(\mu)=$

For the carrot seed germination study:

$$\begin{aligned} P_1 \mathbf{X} \boldsymbol{\beta} &= \frac{1}{n_{..}} \mathbf{1} \mathbf{1}^T \mathbf{X} \boldsymbol{\beta} \\ &= \frac{1}{n_{..}} \mathbf{1} [n_{..}, n_{1.}, n_{2.}, n_{.1}, n_{.2}, n_{.3}, \\ &\quad n_{11}, n_{12}, n_{13}, n_{21}, n_{22}, n_{23}] \boldsymbol{\beta} \\ &= \frac{1}{n_{..}} \mathbf{1} \left(n_{..} \mu + \sum_{i=1}^a n_{i.} \alpha_i + \sum_{j=1}^b n_{.j} \beta_j \right. \\ &\quad \left. + \sum_{i=1}^a \sum_{j=1}^b \gamma_{ij} \right) \end{aligned}$$

The null hypothesis is

$$H_0 : n_{..} \mu + \sum_{i=1}^a n_{i.} \alpha_i + \sum_{j=1}^b n_{.j} \beta_j + \sum_i \sum_j n_{ij} \gamma_{ij} = 0$$

With respect to the cell means

$$E(y_{ijk}) = \mu_{ij} = \mu + \alpha_i + \beta_j + \gamma_{ij}$$

this null hypothesis is

$$H_0 : \sum_{i=1}^a \sum_{j=1}^b \frac{n_{ij}}{n_{..}} \mu_{ij} = 0$$

Consider

$$R(\boldsymbol{\alpha}|\mu) =$$

For the general effects model for the carrot seed germination study:

$$\begin{aligned}
 P_{\mu,\alpha} \mathbf{X} &= \mathbf{X}_{\mu,\alpha} (\mathbf{X}_{\mu,\alpha}^T \mathbf{X}_{\mu,\alpha})^{-1} \mathbf{X}_{\mu,\alpha}^T \mathbf{X} \\
 &= \mathbf{X}_{\mu,\alpha} \begin{bmatrix} n_{..} & n_{1.} & n_{2.} \\ n_{1.} & n_{1.} & 0 \\ n_{2.} & 0 & n_{2.} \end{bmatrix}^{-1} \\
 &\times \begin{bmatrix} n_{..} & n_{1.} & n_{2.} & n_{11} & n_{12} & n_{13} & n_{11} & n_{12} & n_{13} & n_{21} & n_{22} & n_{23} \\ n_{1.} & n_{1.} & 0 & n_{11} & n_{12} & n_{13} & n_{11} & n_{12} & n_{13} & 0 & 0 & 0 \\ n_{2.} & 0 & n_{2.} & n_{21} & n_{22} & n_{23} & 0 & 0 & 0 & n_{21} & n_{22} & n_{23} \end{bmatrix} \\
 &\quad \downarrow \\
 &= \mathbf{X}_{\mu,\alpha} \begin{bmatrix} 0 & 0 & 0 \\ 0 & \frac{1}{n_{1.}} & 0 \\ 0 & 0 & \frac{1}{n_{2.}} \end{bmatrix} \begin{bmatrix} \\ \\ \end{bmatrix} = \\
 &\begin{bmatrix} 1 & 1 & 0 \\ 1 & 1 & 0 \\ \vdots & \vdots & \vdots \\ 1 & 1 & 0 \\ 1 & 0 & 1 \\ \vdots & \vdots & \vdots \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 1 & 0 & \frac{n_{11}}{n_{1.}} & \frac{n_{12}}{n_{1.}} & \frac{n_{13}}{n_{1.}} & \frac{n_{11}}{n_{..}} & \frac{n_{12}}{n_{..}} & \frac{n_{13}}{n_{..}} & 0 & 0 & 0 \\ 1 & 0 & 1 & \frac{n_{11}}{n_{1.}} & \frac{n_{22}}{n_{2.}} & \frac{n_{23}}{n_{2.}} & 0 & 0 & 0 & \frac{n_{21}}{n_{1.}} & \frac{n_{22}}{n_{2.}} & \frac{n_{23}}{n_{1.}} \end{bmatrix}
 \end{aligned}$$

Then, the first seven rows of $(\mathbf{P}_{\mu,\alpha} - \mathbf{P}_{\mu})\mathbf{X}\boldsymbol{\beta}$ are

$$\begin{aligned}
 &\left[\mu + \alpha_1 + \sum_{j=1}^b \frac{n_{1j}}{n_{1.}} (\beta_j + \gamma_{1j}) \right] \\
 &- \left[\mu + \sum_{i=1}^a \frac{n_{i.}}{n_{..}} \alpha_i + \sum_{j=1}^b \frac{n_{.j}}{n_{..}} \beta_j + \sum_i \sum_j \frac{n_{ij}}{n_{..}} \gamma_{ij} \right]
 \end{aligned}$$

The last eight rows of $(P_{\mu,\alpha} - P_{\mu})\mathbf{X}\boldsymbol{\beta}$ are

$$\begin{aligned}
 &\left[\mu + \alpha_2 + \sum_{j=1}^b \frac{n_{2j}}{n_{2.}} (\beta_j + \gamma_{2j}) \right] \\
 &- \left[\mu + \sum_{i=1}^a \frac{n_{i.}}{n_{..}} \alpha_i + \sum_{j=1}^b \frac{n_{.j}}{n_{..}} \beta_j + \sum_i \sum_j \frac{n_{ij}}{n_{..}} \gamma_{ij} \right]
 \end{aligned}$$

The null hypothesis is

$$H_0 : \alpha_i + \sum_{j=1}^b \frac{n_{ij}}{n_{i.}} (\beta_j + \gamma_{ij})$$

are all equal ($i = 1, \dots, a$)

Consider $R(\boldsymbol{\beta}|\boldsymbol{\mu}, \boldsymbol{\alpha}) = \mathbf{y}^T(P_{\mu,\alpha,\beta} - P_{\mu,\alpha})\mathbf{y}$
and the corresponding F-statistic

$$F = \frac{R(\boldsymbol{\beta}|\boldsymbol{\mu}, \boldsymbol{\alpha})/(b-1)}{MSE} \sim F_{(b-1, n_{..}-ab)}(\lambda)$$

Here,

$$\frac{1}{\sigma^2}R(\boldsymbol{\beta}|\boldsymbol{\mu}, \boldsymbol{\alpha}) \sim \chi_{\text{rank}(\mathbf{X}_{\mu,\alpha,\beta}) - \text{rank}(\mathbf{X}_{\mu,\alpha})}^2(\lambda)$$

$\nearrow \quad \nwarrow$
 $[1 + (a-1) + (b-1)] - [1 + (a-1)]$
 $= b - 1$ degrees of freedom

and

$$\lambda = \frac{1}{\sigma^2} \left[(P_{\mu,\alpha,\beta} - P_{\mu,\alpha})\mathbf{X}\boldsymbol{\beta} \right]^T \left[(P_{\mu,\alpha,\beta} - P_{\mu,\alpha})\mathbf{X}\boldsymbol{\beta} \right]$$

$$P_{\mu,\alpha,\beta}\mathbf{X} = \mathbf{X}_{\mu,\alpha,\beta} \left[\mathbf{X}_{\mu,\alpha,\beta}^T \mathbf{X}_{\mu,\alpha,\beta} \right]^{-1} \mathbf{X}_{\mu,\alpha,\beta}^T \mathbf{X}$$

$$= \mathbf{X}_{\mu,\alpha,\beta} \left[\begin{array}{c|cc|ccc} n_{..} & n_{1.} & n_{2.} & n_{.1} & n_{.2} & n_{.3} \\ \hline n_{1.} & n_{11} & 0 & n_{11} & n_{12} & n_{13} \\ n_{2.} & 0 & n_{2.} & n_{21} & n_{22} & n_{23} \\ \hline n_{.1} & n_{11} & n_{21} & n_{.1} & 0 & 0 \\ n_{.2} & n_{12} & n_{22} & 0 & n_{.2} & 0 \\ n_{.3} & n_{13} & n_{23} & 0 & 0 & n_{.3} \end{array} \right]^{-1} \mathbf{X}_{\mu,\alpha,\beta}^T \mathbf{X}$$

\nearrow
 call this $\begin{bmatrix} A & B \\ B^T & C \end{bmatrix}$

$$\begin{aligned} \begin{bmatrix} A & B \\ B^T & C \end{bmatrix}^{-1} &= \begin{bmatrix} A^{-1} & 0 \\ 0 & 0 \end{bmatrix} + \begin{bmatrix} A^{-1}B \\ I \end{bmatrix} [C - B^T A^{-1} B]^{-1} [-B^T A^{-1} \mid I] \\ &= \begin{bmatrix} 0 & 0 \\ 0 & C^{-1} \end{bmatrix} + \begin{bmatrix} I \\ -C^{-1} B^T \end{bmatrix} [A - B C^{-1} B^T]^{-1} [I \mid -B C^{-1}] \\ &= \begin{bmatrix} W & -W B C^{-1} \\ -C^{-1} B^T W & C^{-1} + C^{-1} B^T W B C^{-1} \end{bmatrix} \end{aligned}$$

where $W = [A - B C^{-1} B^T]^{-1}$

The null hypothesis is

$$H_0 : \sum_{i=1}^a \frac{n_{ij}}{n_{.j}} (\beta_j + \gamma_{ij}) - \sum_{i=1}^a \frac{n_{ij}}{n_{.j}} \left(\sum_{k=1}^b \frac{n_{ik}}{n_{i.}} (\beta_k + \gamma_{ik}) \right) = 0$$

for all $j = 1, \dots, b$

With respect to the cell means,

$$E(y_{ijk}) = \mu_{ij},$$

this null hypothesis is

$$H_0 : \sum_{i=1}^a \frac{n_{ij}}{n_{.j}} \mu_{ij} - \sum_{i=1}^a \frac{n_{ij}}{n_{.j}} \left(\sum_{k=1}^b \frac{n_{ik}}{n_{i.}} \mu_{ik} \right) = 0$$

for all $j = 1, 2, \dots, b$.

Consider

$$R(\boldsymbol{\gamma}|\mu, \boldsymbol{\alpha}, \boldsymbol{\beta}) = \mathbf{y}^T [P\mathbf{X} - P_{\mu, \alpha, \beta}] \mathbf{y}$$

and the associated F-statistic

$$F = \frac{R(\boldsymbol{\gamma}|\mu, \boldsymbol{\alpha}, \boldsymbol{\beta}) / [(a-1)(b-1)]}{MSE}$$

$$\sim F_{(a-1)(b-1), n_{..} - ab}(\lambda)$$

The null hypothesis is:

$$H_0 : (\mu_{ij} - \mu_{i\ell} - \mu_{kj} + \mu_{k\ell})$$

$$= (\gamma_{ij} - \gamma_{i\ell} - \gamma_{kj} + \gamma_{k\ell}) = 0$$

for all (i, j) and (k, ℓ) .

CHAPTER 5 TWO-WAY CROSSED CLASSIFICATION

202405

The least squares estimator (b.l.u.e.) for $\boldsymbol{\mu}$ is

MEME16203 LINEAR MODELS©DR YONG CHIN KHIAN

Test the hypotheses are:

The OLS estimator (b.l.u.e.) for $\frac{1}{b} \sum_{j=1}^b \mu_{ij}$ and its variance are

Express the null hypothesis in matrix form:

$$H_0 : C_1\boldsymbol{\mu} = \mathbf{0}$$

Then the OLS estimator (BLUE) of $C_1\boldsymbol{\mu}$, and its variance are:

Compute SS_{H_0} and show that

$$\frac{1}{\sigma^2} SS_{H_0} \sim \chi^2_{(a-1)}(\lambda)$$

Compute:

$$SSE = \mathbf{y}^T(I - P_D)\mathbf{y} \text{ where } P_D = D(D^T D)^{-1}D^T.$$

Show that

$$\frac{1}{\sigma^2} SSE \sim \chi^2_{\Sigma\Sigma(n_{ij}-1)}$$

Show that

$$SSE = \mathbf{y}^T \underbrace{(I - P_D)}_{\nwarrow \text{ call this } A_1} \mathbf{y}$$

is distributed independently of

$$SS_{H_0} = \mathbf{y}^T \underbrace{D(D^T D)^{-1} C_1^T [C_1 (D^T D)^{-1} C_1^T]^{-1} C_1 (D^T D)^{-1} D^T}_{\nwarrow \text{ call this } A_2} \mathbf{y}$$

Then $F =$

Test

$$H_0 : \frac{1}{a} \sum_{i=1}^a \mu_{i1} = \frac{1}{a} \sum_{i=1}^a \mu_{i2} = \cdots = \frac{1}{a} \sum_{i=1}^a \mu_{ib}$$

vs.

$$H_A : \frac{1}{a} \sum_{i=1}^a \mu_{ij} \neq \frac{1}{a} \sum_{i=1}^a \mu_{ik} \quad \text{for some } j \neq k$$

Write the null hypothesis in matrix form as

$$H_0 : C_2 \boldsymbol{\mu} = \mathbf{0}$$

where $C_2 =$

then $C_2 \boldsymbol{\mu} =$

Compute $SS_{H_{0,2}}$ and reject H_0 if $F =$

Test for Interaction:

Test

$H_0 : \mu_{ij} - \mu_{i\ell} - \mu_{kj} + \mu_{k\ell} = 0$ for all (i, j) and (k, ℓ) vs.

$H_A : \mu_{ij} - \mu_{i\ell} - \mu_{kj} + \mu_{k\ell} \neq 0$ for all (i, k) and $(j \neq \ell)$.

Write the null hypothesis in matrix form as

$$H_0 : C_3 \boldsymbol{\mu} = \mathbf{0}$$

and perform the test.

| Source of variation | Sum of d.f. | Mean Squares | Square | F | p-value | |
|---------------------|--------------|------------------|--------|--------|---------|-------|
| Soils | a-1=1 | $SS_{H_0} =$ | 123.77 | 123.77 | 9.28 | .0139 |
| Var. | b-1=2 | $SS_{H_{0,2}} =$ | 192.13 | 96.06 | 7.20 | .0135 |
| Inter. | (a-1)(b-1)=2 | $SS_{H_{0,3}} =$ | 222.76 | 111.38 | 8.35 | .0089 |

Note that

$$\begin{aligned} &\mathbf{y}^T P_1 \mathbf{y} + \mathbf{y}^T D(D^T D)^{-1} [C_1(D^T D)^{-1} C_1^T]^{-1} \\ &\quad C_1(D^T D)^{-1} D^T \mathbf{y} \\ &+ \mathbf{y}^T D(D^T D)^{-1} C_2^T [C_2(D^T D)^{-1} C_2^T]^{-1} \\ &\quad C_2(D^T D)^{-1} D^T \mathbf{y} \\ &+ \mathbf{y}^T D(D^T D)^{-1} C_3^T [C_3(D^T D)^{-1} C_3^T]^{-1} \\ &\quad C_3(D^T D)^{-1} D^T \mathbf{y} \\ &+ \mathbf{y}^T (I - P_D) \mathbf{y} \end{aligned}$$

do not necessarily sum to $\mathbf{y}^T \mathbf{y}$, nor do the middle three terms (SS_{H_0} , $SS_{H_{0,2}}$, $SS_{H_{0,3}}$) necessarily sum to

$$SS_{\text{model,corrected}} = \mathbf{y}^T (P_D - P_1) \mathbf{y} ,$$

nor are (SS_{H_0} , $SS_{H_{0,2}}$, $SS_{H_{0,3}}$) necessarily independent of each other.

Example 3.

A chemical production process consists of a first reaction with an alcohol and a second reaction with a base. A 3×2 factorial experiment with three alcohols and two bases was conducted. The data had unequal replications among the six treatment combinations of the two factors, Base and Alcohol. The collected data are percent yield. The data are given below.

| Base | Alcohol | | | | | |
|------|---------|------|------|------|------|------|
| | 1 | | 2 | | 3 | |
| 1 | 90.0 | 91.3 | 89.4 | 88.1 | 90.2 | 87.9 |
| | | | 90.0 | | 89.4 | 91.5 |
| 2 | 87.5 | 89.4 | 96.0 | | 94.1 | 92.5 |
| | 91.8 | | | | 92.8 | |

Consider the model $y_{ijk} = \mu_{ij} + \epsilon_{ijk}$, where $\epsilon_{ijk} \sim NID(0, \sigma^2)$, $i = 1, 2$, and $j = 1, 2, 3$ and $k = 1, \dots, n_{ij}$. This model can be expressed in matrix form as $\mathbf{Y} = \mathbf{D}\boldsymbol{\beta} + \boldsymbol{\epsilon}$. Examine type III sums of squares for these data.

- (a) Specify the \mathbf{C} matrix needed to write the null hypothesis associated with the F-test for Alcohol effects in the form $H_0 : \mathbf{C}\boldsymbol{\beta} = \mathbf{0}$.

- (b) Present a formula for SS_{H_0} , corresponding to the null hypothesis in part (a), and state it's distribution when the null hypothesis is true.

- (c) Compute SS_{H_0} .

5.4 Balanced Factorial Experiments

$$n_{ij} = n \quad \text{for} \quad \begin{matrix} i = 1, \dots, a \\ j = 1, \dots, b \end{matrix}$$

Example 4. Sugar Cane yields
Nitrogen Level

| | 150 lb/acre | 210 lb/acre | 270 lb/acre |
|-----------|------------------|------------------|------------------|
| Variety 1 | $y_{111} = 70.5$ | $y_{121} = 67.3$ | $y_{131} = 79.9$ |
| | $y_{112} = 67.5$ | $y_{122} = 75.9$ | $y_{132} = 72.8$ |
| | $y_{113} = 63.9$ | $y_{123} = 72.2$ | $y_{133} = 64.8$ |
| | $y_{114} = 64.2$ | $y_{124} = 60.5$ | $y_{134} = 86.3$ |
| Variety 2 | $y_{211} = 58.6$ | $y_{221} = 64.3$ | $y_{231} = 64.4$ |
| | $y_{212} = 65.2$ | $y_{222} = 48.3$ | $y_{232} = 67.3$ |
