TOPIC 7 YIELD RATES 202306

7.1 Reinvestment Rates

Previously, we assume that the reinvestment rate is level throughout the entire period of invest-(investor) may be able to reinvest the payments the original investment. Hence, the reinvestment rate is usually lower than the yield rate. This is ment and equals to IRR. In practice, the lender from the borrower at rates higher or lower than demonstrated with the following types of invest-

- 1. D for n periods at rate i s.t. the interest is reinvested at rate j:
- i account

 \Box AV =

j account

 $AV = D + iDs_{\overline{m}i}.$

at rate i s.t. the interest is reinvested at rate j: 2. D at the beginning of each period for n periods TOPIC 7 YIELD RATES 202306

j account

iD 2iD (n-1)iD niD |

 $AV = iD(Is)_{-}(n)|j$

 $= nD + iD \left\lfloor \frac{s_{\overline{n+1}} - (n+1)}{n} \right\rfloor$ $AV = nD + iD(Is)_{\overline{n}|j}$

TOPIC 7 YIELD RATES

3. A loan of amount L and receives n periodic payments of R at interest rate i as received, but can reinvest them at rate j. The adjusted yield rate, i', is governed by

$$L(1+i')^n = Rs_{\overline{n}j}.$$

4. A bond is purchased for P, coupons of Fr are paid at the end of each period for n periods, the bond is redeemed for C at the end of n periods, and coupons are reinvested at rate j. Hence i' satisfies

$$P(1+i')^n = Frs_{\overline{n}|j} + C.$$

Example 1.

1000 is invested at the beginning of year 1 for 15 years at 11%. The interest is reinvested at 5.5%. What is the total AV at the end of 15 years?

Example 2 (T7Q1).

an investor should pay to produce a yield rate of Payments of 1,000 are invested at the beginning of each year for 10 years. The payments earn interest at 7% effective and the interest can be reinvested at 5% effective. Find the purchase price 8% effective.

Example 3 (T7Q2). 202306

TOPIC 7 YIELD RATES

nual coupons is selling for 88. If the coupons from the bond can be reinvested at only i1% convertible semiannually. Find the yield rate convertible semiannually taking into account rein-A 100 par value 20-year bond with 9% semianvestment rates.

Example 4 (T7Q3).

compounded semiannually. What nominal rate of back the loan over 7 years with monthly payments payable at the end of each month. Sally can reinvest the monthly payments from Tim in a savings account paying interest at 6%, compounded interest, compounded monthly, did Sally charge Sally lends 60,000 to Tim. Tim agrees to pay ment over the 7-period turned out to be 6.45%monthy. The yield rate earned on Sally's invest-Tim on the loan?

7.2 Dollar Weighted Interest Rates 202306

6 months. The same fund earns a nominal rate 6 months. which of the following schedules of of 20% compounded semiannually in the second deposits would result in a higher equivalent level of 100% compounded semiannually in the first Suppose a fund earns a nominal rate of interest effective rate of interest for the year?

(a) \$100 at time 0 and \$10 at time $\frac{1}{2}$.

(b) \$10 at time 0 and \$100 at time $\frac{1}{2}$.

The results under the two schedules of deposits are as follows:

(a) 100(1.5)(1.1) + 10(1.1) = 176

Using simple interest from the date of each deposit to approximate the equivalent level 100(1+i) + 10(1+i/2) = 176annual effective rate i:

$$100(1+i) + 10(1+i/2) = 52.86\%$$

(b) 10(1.5)(1.1) + 100(1.1) = 126.5

Using simple interest from the date of each deposit to approximate the equivalent level annual effective rate i:

$$10(1+i) + 100(1+i/2) = 126.5$$

$$i = 27.5\%$$

From the above results, we see that the effective annual rate is very much dependent on the amount of dollars invested. When we use the actual dollars invested in computing the effective rate, the rate is referred to a **dollar-weighted** rate of interest.

Let

- A be the amount in the fund at the beginning of the year;
- ullet B be the amount in the fund at the end of the year; and
- C_t be the deposit in (positive value) or the withdrawal from (negative value) the fund at time t

UECM1404 THEORY OF INTEREST

202306

TOPIC 7 YIELD RATES

$$A(1+i) + \sum_{i=0}^{\infty} C_t(1+i)^{1-t} = B$$

Assuming simple interest from the date of each deposit or withdrawal to the end of the year, we have:

$$A(1+i) + \sum C_t[1+(1-t)i] = B$$
$$i_{DW} = \frac{B-A-\sum C_t}{A+\sum C_t(1-t)}$$

Notes:

- $\sum C_t = \text{Total Deposit}$ Total Withdrawal
- $B A \sum C_t = \text{Investment Income}$

UECM1404 THEORY OF INTEREST

Example 5 (T7Q4).

An investment fund has a value of 5,000 at the beginning and the end of the year. A deposit of 1000 was made at the end of 4 months. A withdrawal of 1500 was made at the end of 7 months. Find the rate of interest earned by the fund assuming simple interest during the year.

202306 TOP

Example 6.

An association had a fund balance of 80 on January 1 and 65 on December 31. At the end of every month during the year, the association deposited 13 from membership fees. There were withdrawals of 7 on February 28, 35 on June 30, 98 on October 15, and 45 on October 31. Calculate the dollar-weighted rate of return for the year.

7.3 Time-Weighted Interest Rate

The dollar-weighted methods for computing the yield rate earned by an investment fund are sensitive to the amounts of money invested during various subperiods when the investment experience is volatile during the year. A better measure of A fund's underlying performance is to determine the yield rate based on investing a single amount at the beginning of the year, with no further deposits or withdrawals. This rate is called the time-weighted rate of interest.

Let

• $B_k = \text{Balance just preceding deposits or with-drawals at time } t_k$

 \bullet $W_k = \text{Deposit}(+)$ or withdrawal(-) at t_k

 $\bullet \ W_0 = W_n = 0$

Define interest over $[t_{k-1}, t_k]$ = $B_k - (B_{k-1} + W_{k-1})$

UECM1404 THEORY OF INTEREST

202306

TOPIC 7 YIELD RATES

Let i_k be the effective rate of interest over the

Define i_k :

interval $[t_{k-1}, t_k]$

$$i_k(B_{k-1}+W_{k-1})=B_k-(B_{k-1}+W_{k-1}))\\$$

7

$$i_k = \frac{B_k - (B_{k-1} + W_{k-1})}{B_{k-1} + W_{k-1}}$$

and

$$1 + i_k = \frac{B_k}{B_{k-1} + W_{k-1}}$$

The time-weighted rate of return,

$$i_{tw} = (1+i_1)(1+i_2)\cdots(1+i_n)-1$$

Remarks:

(i) The formula for i_k looks complicated, but it is just "interest earned" in the period divided by balance at beginning of period. Interest earned can be positive, negative, or zero.

Interest earned = $B_k - (B_{k-1} + W_{k-1})$

UECM1404 THEORY OF INTEREST

TOPIC 7 YIELD RATES

202306

- (ii) If balances are not given (and cannot be determined from other information) you can't calculate time-weighted rate of return.
- $\{[t_{k-1}, t_k]\}$ are not necessarily equal in length. (not necessarily a year). The subintervals lated as a rate for the entire period $[0,t_n]$ (iii) time-weighted rate return is always calcu-
- (iv) If the time-weighted rate is calculated for a period of n years, then the equivalent annual rate is the solution to $(1+i)^n = (1+it_w)$.

Example 7 (T7Q5).

calculation of this balance, 847 is withdrawn from the account. 14,520 is in the account on January 1, 2021. What is the time-weighted rate of return ., 2020, the balance is 12,100. Immediately after 11,000 is invested on January 1, 2020. On July over 2020?

202306

Example 8.

the investment account is worth 2,600. what is September 1, the value has increased to 3,120 and and 2000 of new principal deposited. On April 1, the value of the account has increased to 2,600and an additional deposit of 840.0 is made. On 680.0 is withdrawn. On the following January 1, An investment account has 0 in it on January 1 the time-weighted rates of interest for the year?

TOPIC 7 YIELD RATES 202306

Example 9.

An investor deposits 50 in an investment account on January 1. the following summarizes the activity in the account during the year:

Value Immediately

Deposit	20	80	75
Before Deposit	40	80	175
Date	March 15	June 1	October 1

annual yield during the first 6 months is equal to the (time-weighted) annual effective yield during Using the time-weighted method, the equivalent On June 30, the value of the account is 157.50, On December 31, the value of the account is X. the entire 1-year period. Calculate X. 236.25

Example 10 (7706).

The following table gives information concerning an investment fund (in RM millions):

Calendar Year	2019	2019 2020 2021 2022	2021	2022	
Value of fund at 30 June	I	480	520 740	740	
Net cash flow received on 1 July	į	46	47	65	
Value of fund at 31 December	410	550	009	×	

If the time weighted rate of return earned on the fund during the period from 31 December 2019 to 31 December 2022 is 10% per annum effective, calculate X, the value of the fund on 31 December 2022.
