UECM1404 THEORY OF INTEREST

202306 TOPIC 6 BONDS

--

6 Bonds

One of the major applications of the theory of interest is the determination of prices and values for bonds and other securities, such as preferred stock and common stock. There are three main questions related to securities:

- 1. Given the desired yield rate of an investor, what price should be paid for a given security?
- 2. Given the purchase price of a security, what is the resulting yield rate to an investor?
- 3. What is the value of a security on a given date after it has been purchased?

6.1 Price of a Bond

tity or corporation on which we typically receive A bond is basically a loan to a governmental eninterest payments called "coupons", and then receive the redemption value on the redemption

Formal notations:

- P =the price of a bond;
- \bullet F = the par value, or face amount. It is printed on the front of the bond and is often is customary to quote bond prices in terms of the amount payable at the maturity date. It a par value of 100;
- the amount of money paid at a redemption date to the holder of the bond. Often C = F, • $C = \text{the } redemption \ value \ \text{of a bond}$. It is however there are exceptions.

UECM1404 THEORY OF INTEREST

period. The most common frequency for bond coupons in the US is semiannual. E.g. an 8% In the international financial markets, there • r =the $coupon \ rate$, rate per coupon payment bond with semiannual coupons has r = 0.04. are other coupon frequencies. TOPIC 6 BONDS 202306

- Fr =the amount of the coupon;
- $g = \frac{FT}{C}$ is the modified rate of the bond. We have Cg = Fr. (If a bond is redeemable at par, C = F and g = r.)
- $i = \text{the } yield \ rate \ \text{of the bond, i.e.}$ the rate realized by the investor, or the internal rate of return, or the yield to maturity.
- n = the number of coupon payment periods;
- $K = Cv^n =$ the present value of the redemp-
- $G = \frac{Fr}{i}$, the base amount of a bond;

6.1.1 Basic Formulas:

The price of a bond to yield an effective rate *i* is the PV of bond payments at that rate. The PV of the payments is the PV of the coupons plus the PV of the redemption value:

$$P = Fra_{\overline{n}|} + Cv^n$$

Oľ

$$P = Cga_{\overline{n}} + Cv^n$$

6.1.2 The Premium/Discount Formula

Since $a_{\overline{n}|} = \frac{1-v^n}{i}$, and $v^n = 1 - ia_{\overline{n}|}$:

$$P = Fra_{\overline{m}} + Cv^n$$

$$= Fra_{\overline{m}} + C(1 - ia_{\overline{m}})$$

$$= C + (Fr - Ci)a_{\overline{m}}$$

$$= C + (Cg - Ci)a_{\overline{m}}$$

TOPIC 6 BONDS

Example 1.

A 20-year 9,000 par value bond with 11% semiannual coupons is purchansed to earn a yield of 9% convertible semiannually. What is the price of the bond?

Example 2.

Find the price to yield 4% effective for a 100 bond with 5.5% annual coupons redeemable at 110 in 10 years, using the basic formula and premium/discount formula. [118.92]

TOPIC 6 BONDS 202306

Example 3 (T06Q1).

John buys a bond that is due to mature at par in 7 year. It has a 800 par value and coupons at 5% convertible semiannually. John pays 873.57 to obtain a yield rate i convertible semiannually, i > 0. Calculate i.

UECM1404 THEORY OF INTEREST

Example 4.

with coupons at 10% convertible semiannually which will be redeemed for C. The purchase price is 702.0 and the present value of the redemption John purchases a 1000 par value 10-year bond value is 210.9. Calculate C.

TOPIC 6 BONDS

Example 5.

with coupons at 8% convertible semiannually which Jeremy purchases a 1900 par value 12-year bond will be redeemed for R. The purchase price is 1056.2 and the present value of the redemption value is 254.01. Calculate R.

UECM1404 THEORY OF INTEREST

A 30-year bond with coupons at 14% convertible

Example 6 (706Q2).

quarterly will be redeemed at 1,700. The bond is bought to yield 16% convertible quarterly. The

purchase price is 834. Calculate the par value.

202306

TOPIC 6 BONDS

Example 7.

A 1,000 bond with with annual coupons is redeemable at par at the end of 9 years. At a purchase price of 910, the yield rate is i. The coupon rate i - 0.03. Calculate i.

UECM1404 THEORY OF INTEREST

UECM1404 Theory of Interest

Example 8 (T06Q3).

A 1000 par value 17-year bond with annual coupons and redeemable at maturity at 1080 is purchased for P to yield an annual effective rate of 8.42%. The first coupon is 75. Each subsequent coupon is 5% greater than the preceding coupon. Determine P.

202306 TOPIC 6 BONDS

Example 9.

Two bonds are purchased for the same price to yield 5%. Bond X has 4% annual coupons and matures for its face value of 100. Bond Y has annual coupons of 3 and matures for 180. Both bonds mature at the end of n years. Calculate n.

| | UECM1404 Theory of Interest

Example 10.

A 1,000 par value 3-year bond with annual coupons of 50 for the first year, 70 for the second year and 90 for the third year is bought to yield a force of interest.

$$\delta_t = \frac{2t - 1}{2(t^2 - t + 1)} \text{ for } t \ge 0.$$

Calculate the price of this fund. 502.4

Example 11.

TOPIC 6 BONDS

A 100 par value 100-year bond with a redemption value of 100 has annual coupons of 10% for the first 10 years, 9% for the next 10 years, 8% for the next 10 years, ..., 1% for the last 10 years. Show that the price of the bond to yield *i* is

$$\frac{10s_{\overline{10}|} - a_{\overline{100}|}}{is_{\overline{10}|}} + 100v^{100}$$

UECM1404 THEORY OF INTEREST

Example 12 (T06Q4).

A 5,000 par value 2-year bond with semiannual coupons of 250 for the first half year, 375 for the second half year, 450 for the third half year, and 550 for the forth half year is purchased to yield i% convertible semiannually. The price of the bond is 5,482.27. Calculate i.

202306 TOPIC 6 BONDS

6.2 Premium and Discount

When a bond is purchased for more than its redemption value, the excess of the price over the redemption value is called the "premium". When a bond is purchased for less than its redemption value, the excess of the price over the redemption value is called the "discount".

The premium/discount formula is ideal for quickly determining whether a bond is sold at a premium or discount:

$$P = C + (Cg - Ci)a_{\overline{n}}$$

Thus

- 1. If g > i, then P > C and the bond is purchases at a premium equal to $P C = (Cg Ci)a_{\overline{n}|}$.
- 2. If g < i, then P < C and the bond is purchases at a discount equal to $C P = (Cg Ci)a_{\overline{m}}$.

202306

Example 13.

A 1,000 bond with 8% semiannual coupons redeemable at 1,050 in 1.5 years, purchased to yield a nominal annual rate of 6% compounded semiannually.

- (a) Determine whether the bond is purchased at a premium or discount.
- (b) What is the amount of premium/discount?

Example 14.

You are given:

- (i) A 10-year 8% semiannual coupon bond is purchased at a discount of X.
- (ii) A 10-year 9% semiannual coupon bond is purchased at a premium of Y.
- (iii) A 10-year 10% semiannual coupon bond is purchased at a premium of 2X.
- (iv) All bonds were purchased at the same yield rate and have par values of 1000.

Calculate Y. 0.5X

6.3 Bond Amortization

When a bond is bought at a premium (g > i), the discount (g < i), the book value will gradually This process is called amortization of premium or "write down." When a bond is bought at a be adjusted upward. This process is called accumulation of discount or "write ups." The concept of the bond amortization is the same as the loan amortization, however, bond terminology is difbook value will gradually be adjusted downward.

- (i) "Book value" is used instead of "outstanding loan balance."
- reduction in the book value is called the "amount (ii) Instead of "principal repaid," the periodic for amortization of premium." if the bond is purchased at premium and the periodic increase in the book value is called the 'amount for accumulation of discount"
- (iii) Instead of "payment amount," coupon is used.

UECM1404 THEORY OF INTEREST

Bond Amortization When a Bond TOPIC 6 BONDS 6.3.1202306

Consider a 1,000 bond with 8% semiannual coupons redeemable at 1,050 in 1.5 years, purchased to is Purchased At a Premium

 $B_0 = P = Fra_{\overline{n}|i} + Cv^n = 1000(.04) \left[\frac{1 - 1.03^{-3}}{.03} \right] +$ amortization schedule:

yield a nominal annual rate of 6% compounded semiannually. We construct the bond a bond

 $1050(1.03^{-3}) = 1074.04$

		Book Value	$B_t = B_{t-1} - P_t$	1,074.04	1,066.26	1,058.25	1,050.00		
Amount for	Amortization	of Premium	Period t Coupon $I_t = iB_{t-1}$ $P_t = \text{Coupon } -I_t$ $B_t = B_{t-1} - P_t$		7.78	8.01	8.25	24.04	
	Interest	Earned	$I_t = iB_{t-1}$		32.22	31.99	31.75	95.96	
			Coupon		40	40	40	120	
			Period t	0	\vdash	2	33	Totals	

Notes:

retrospectively: $B_t = B_0(1+i)^t - Frs_{\overline{t}}$ Prospectively: $B_t = Fra_{n-t} + Cv^{n-t}$ 1. Book Value, $B_t = B_{t-1} - P_t$ or

2.
$$I_t = [iB_{t-1}]$$

= $i[Fra_{n-t+1}] + Cv^{n-t+1}]$
= $Fr(1 - v^{n-t+1}) + Civ^{n-t+1}$
= $Fr - (Fr - Ci)v^{n-t+1}$

3. The amounts for amortization of premium (write

$$P_t = Fr - I_t$$

$$= (Fr - Ci)v^{n-t+1}$$

$$= (Cg - Ci)v^{n-t+1}$$

4. P_t are also in geometric progression with common ratio (1+i).

$$P_t = (1+i)^{t-1} P_1$$

5. P_t in this case is also called "write down" because the asset value of a bond is "written down" by this amount each period.

UECM1404 THEORY OF INTEREST

TOPIC 6 BONDS

6. Total Interest Earned

= Total payments received - Amount invested

$$\sum_{t=1}^{n} I_t = (nFr + C) - P$$

For this bond:

Total payments received

= 3 coupons + redemption value

 $= 3 \times 40 + 1,050 = 1,170$

The amount invested = 1,074.04, so,

Total Interest Earned = 1,170 - 1074.04 =

7. The total of the amounts for amortization of premium = Premium.

$$\sum_{t=1}^{n} P_t = P - C$$

Premium = $P - C = (cg - ci)a_{\overline{n}}$ $= [40 - 1050(0.03)]a_{\overline{3}}$

25

202306

C

Example 15.

A 1000 par value 13-year bond with 11% semiannual coupons was bought to yield 10.5% convertible semiannually. Determine the amount of premium amortized (write down) in the 8th coupon payment.

Example 16 (T06Q5).

An actuary finds a 20-year bond that was purchased at a premium has determined the following:

- The bonds pays semiannual interest.
- The amount for amortization of the premium in the 2nd coupon payment was 976.33.
- The amount for amortization of the premium in the 4th coupon payment was 1040.9.

What is the value of the premium?

UECM1404 THEORY OF INTEREST

chased to yield 10% convertible semiannually. Par

value equals redemption value. The interest paid

At what nominal rate of interest (express in %) portion of the first semiannually coupon is 299.36.

nual coupons is selling for 81. Find the yield rate

convertible semiannually.

6.4 Determination of Yield Rates

Up to now, we have usually assumed that the yield rate is known and that the price has to be known, and most of the times the equation of computed. In this section, the yield rate is unvalues has to be solve numerically. In the case of a bond, using the Basic formula, we are looking for the solution of the equation for i:

$$P = Fra_{\overline{n}|} + Cv^n$$

use the Table in TI30 calculator to search the where P, Fr, C and n are known. We have to solution.

A 1,000 19-year 14% bond with semiannual coupons is purchased for 1039. The redemption value is 1,000. The coupons are reinvested at a nominal annual rate of 6%, compounded semiannually. Determined the purchaser's annual effective yield rate over the 19 year period.

202306 To

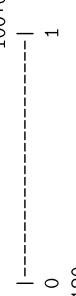

TOPIC 6 BONDS

6.5 Callable Bonds

Many bonds have the options that permits the borrowers to redeem ("call") the bonds prior to the normal maturity date. The main reason for doing this is to take the advantage of a decline in interest rates. These kind of bonds is called callable bonds.

6.5.1 Rules For Calculating Callable Bond Price

1. If the bond sells at a Premium (i < r), the Earliest redemption date is the Worst (**PEW**). Consider a bond selling at a premium, say a 100 bond that sells for 120 with 6% annual coupons. Assume the bond is redeemed in a year,

120

UECM1404 THEORY OF INTEREST

106 at the end of a year. There is a "loss" of value (i.e., the premium). This is offset by the On an investment of 120, we get back only 20, the excess of the price over the redemption 6 coupon, for a net loss of 14 in one year on an investment of 120. so

Yield rate =
$$-\frac{14}{120}$$
 = -11.67%

The more years that we can spread the 20 rate would be negative if the bond were called 120 investment). The yield rate will be positive if the bond were called at the end of 4 loss over, the better the yield rate. The yield within 3 years (We would get back less that

Yield rate at the end of 4 year $=\frac{4}{120}=3.33\%$

UECM1404 THEORY OF INTEREST

202306

TOPIC 6 BONDS

2. If the bond sells at a Discount (i > r), the Latest redemption date will be the Worst. Take any bond selling at a discount, say a 100 bond with 6% annual coups selling for 80. Assume the bond is redeemed in a year,

100

The "gain" of 20 is received in one year, plus a 6 coupon. Thus, there is a total return of 26 on an investment of 80, for an exact effective yield rate of $\frac{26}{80} = 32.5\%$. If the bond is redeemed later, the discount of 20 is spread over more years, which dilutes the effective rate. Thus, for discount bonds, the **latest** redemption date is worst.

Example 28.

A 100 bond with 6% annual cuopons and a maturity date 20 years from now can be called at par on any coupon due date starting 10 years from now. What is the highest price an investor can pay and still be certain of a yield of at least 4%?

202306 TOPIC 6 BONDS

Example 29 (T06Q10).

A 1000 bond with 6% annual cuopons and a maturity date 28 years from now can be called at par on any coupon due date starting 14 years from now. What is the price an investor pay to get a minimum yield rate of 8% effective? If this price is paid, what is the maximum yield rate the investor can earn?

UECM1404 THEORY OF INTEREST

202306

47

Example 30.

An investor bought a 15-year bond with par value of 100,000 and 8% semiannual coupons. The bond is callable at par on any coupon date beginning with the 24th coupon. Find the price paid that will yield a rate not less that $i^{(2)} = 10\%$.

redeemable at par that pays 8% semiannual coupons Example 31. An investor purchases a 1,000 bond and matures in 10 years. The bond will yield 7% is called in five years, the minimum redemption value the investor needs to realize the same yield convertible semiannually to maturity. If the bond is X. Determine X.

A More General Principle 6.5.2

It is possible to state a more general principle situations where it may not be clear whether the because the redemption values are not the same that covers both premium and discount situations. This principle also cover more complex earliest or latest redemption date should be used, on different call dates.

a specified minimum yield rate, we compute the In the general principle, to ensure that we earn lowest price for all of the possible redemption dates at this yield. For example, consider Example 28. Using the premium/discount formula:

$$P = C + (Fr - Ci)a_{\overline{n}}$$

$$= 100 + (6 - 4)a_{\overline{n}}4\%$$

$$= 100 + 2a_{\overline{n}}$$

The possible values of n are from n = 10 to n = 20. The lowest price is the price when n = 10, which has the same result in Example 28.

UECM1404 THEORY OF INTEREST

202306

TOPIC 6 BONDS

In Example ??, using the premium/discount for-

$$P = C + (Fr - Ci)a_{\overline{n}|}$$

$$= 100 + (6 - 8)a_{\overline{n}|8\%}$$

$$= 100 - 2a_{\overline{n}|8\%}$$

Again, the possible values of n are from n = 10to n = 20. the lowest price is the price when n = 20.

51

Example 32.

15 years is callable on any coupon date after the ensure an investor minimum yield of 3% per an-A 5% semiannual coupon 100 bond maturing in 10th. If called on the 11th through 20th coupon date, the redemption value would be 110. If called on the 21st through 30th coupon date, redemption would be at par. Find the price that would num compounded semiannually. [117.9]
